

The ZYTO Compass uses Galvanic Skin Response (GSR) to determine your biological coherence for virtual items representing specific nutritional products, oils, and supplements. This information helps you make better decisions about which wellness products to purchase and use.

Making Better Decisions

The Compass software analyzes your body's GSR against a specific library of virtual items to determine which products your body reacts to most coherently. This is called biocommunication. When you place your hand on the ZYTO Hand Cradle, electrical stimuli are sent to the body and the Hand Cradle measures your body's GSR. The Compass software analyzes the GSR data and ranks the products in comparison with your baseline GSR based on affinity. The Compass then generates a report showing the products that your body responded to more coherently, helping you make better decisions to maintain optimal health.

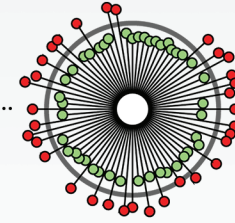

What benefits should I expect?

Even though there are many excellent nutritional supplements to choose from, one size does not fit all and your individual needs change from time to time – making it difficult to know what products, oils, and supplements would most benefit you today.

You want to invest in supplements that will do you the most good. By making the right choices you're less likely to spend money on things you don't need and are more likely to get the wellness benefits you're looking for.

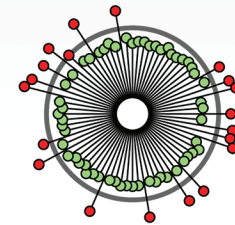

ZYTO biocommunication technology has been used by thousands of professionals to help their customers make better choices. With the Compass, you get this same advantage: Decision support to maintain overall wellness.
